

Congratulations on moving forward through our interview process. For our next step, we'd like to present you with a small creative challenge.

This challenge is to build a website where a user can ask questions and others be able to reply with answers.

We've deliberately kept the scope as light as possible to give freedom in the solution and your priorities, however there are a few guidelines:

- You can use any language, framework or dependency you like
- Your solution should be browser accessible
- You should ideally not spend much more than 2 hours on this - we're not looking for something that's gold plated or feature rich.

Other than that, the choice of what you build or not build is entirely up to you. We're not just interested in what you end up creating, we're interested in how you build it and what considerations or trade-offs you make.

Once you're done please share a link to the accessible repo, or zip your files and email them back to us, along with any notes you may have for context.

If you have any questions in the meantime, please just ask. During our next discussion, we'll cover this assessment, your considerations, how you approached it and the trade-offs you had to make.
